

# Manfrotto ND Filters

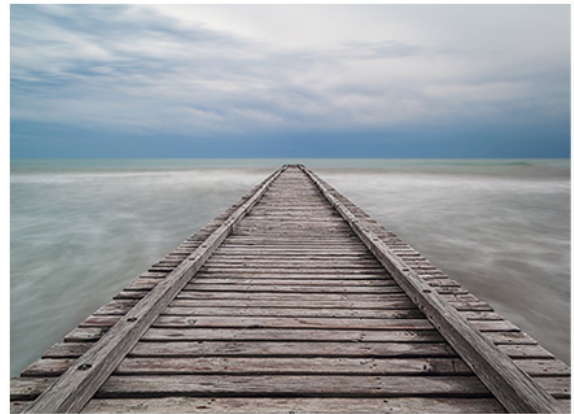

Neutral density filters reduce the amount of light hitting the camera sensor without altering the color of the scene. They are used in a variety of situations, for example in low shutter speed photography for expressing the motion of moving object through long exposure time or to eliminate the moving object in a scene.

## Create Misty Seascapes with a ND Filters

## Create Serene Landscapes with ND Filters

Each filter is provided with a reusable storage case which ensures the highest level of protection to the filters when they are off-camera enabling photographers to easily store and conveniently transport their filter. These cases have been cleverly constructed to include graduated scales which indicate the size of the filter inside the case, enabling photographers to easily identify the filter they require.

## Unique Filter Case

### Available in:

- ND500 (9-stops)
- ND64 (6-stops)
- ND8 (3-stops)
